Sample Questions and Detailed Answers from the January 23, 2013 Exam

Below are examples of typical questions from the exam, along with comprehensive answers and explanations to help deepen understanding.

Question 1: Ecology and Food Webs

Which of the following best describes the role of decomposers in an ecosystem?

- A) They produce energy through photosynthesis.
- B) They break down dead organic matter, returning nutrients to the environment.
- C) They consume primary producers.

D) They compete with herbivores for food.

Answer: B) They break down dead organic matter, returning nutrients to the environment.

Explanation: Decomposers, such as fungi and bacteria, play a vital role in ecosystems by breaking down dead organisms and organic waste. This process releases nutrients back into the soil or water, making them available for plants and other producers, completing the nutrient cycle.

Question 2: Human Body Systems

Describe how the circulatory and respiratory systems work together to oxygenate blood.

Answer:

The respiratory system brings oxygen into the lungs during inhalation. In the alveoli of the lungs, oxygen diffuses across thin membranes into the capillaries. The circulatory system then transports this oxygen-rich blood from the lungs to tissues throughout the body via the heart and blood vessels. At the same time, carbon dioxide, a waste product of cellular respiration, is transported from tissues back to the lungs through the circulatory system, where it is expelled during exhalation.

Explanation:

This collaboration ensures that oxygen reaches cells for energy production and that carbon dioxide is removed, maintaining homeostasis and proper cellular function.

Question 3: Genetics

If a tall plant (T) is crossed with a short plant (t), and all the offspring are tall, what can be concluded about the alleles?

A) Tall is recessive.

B) Tall is dominant.

C) The cross was between two heterozygous plants.

D) The short trait is incomplete dominance.

Answer: B) Tall is dominant.

Explanation: Since all offspring are tall when crossing a tall plant with a short plant, it suggests that

the tall trait (T) is dominant over the short trait (t). The short trait is recessive and only appears when homozygous recessive (tt).

Question 4: Evolution

Explain how natural selection can lead to the development of antibiotic resistance in bacteria.

Answer:

When an antibiotic is used, most bacteria are killed, but some may possess genetic mutations that confer resistance. These resistant bacteria survive and reproduce, passing resistance genes to their offspring. Over time, the population of bacteria becomes predominantly resistant due to this selective pressure. This process, known as natural selection, results in a bacterial population that can withstand antibiotics that previously were effective.

Explanation:

This phenomenon underscores the importance of responsible antibiotic use to prevent the development of resistant strains.

Detailed Answers and Explanations to the January 23, 2013 Living Environment Regents

Multiple Choice Section

The multiple-choice questions served as an initial assessment of fundamental concepts. Here are some representative questions with detailed explanations of their correct answers:

Question 1:

Which organelle is primarily responsible for producing energy in a cell?

- a) Nucleus
- b) Mitochondria
- c) Chloroplast
- d) Ribosome

Answer: b) Mitochondria

Explanation: The mitochondria are known as the "powerhouses" of the cell because they generate adenosine triphosphate (ATP), which provides energy for cellular activities. The nucleus controls the cell's activities, chloroplasts carry out photosynthesis in plant cells, and ribosomes synthesize proteins.

Question 2:

In a Punnett square for a heterozygous tall plant crossed with a homozygous short plant, what is the probability that the offspring will be tall?

- a) 25%
- b) 50%
- c) 75%
- d) 100%

Answer: b) 50%

Explanation: Assuming 'T' is tall and 't' is short, the heterozygous tall plant is Tt, and the homozygous short plant is tt. Crossing Tt x tt yields offspring with genotypes Tt (tall) and tt (short) in a 1:1 ratio, meaning a 50% chance of tall offspring.

Short Answer and Data-Based Questions

These questions required students to interpret diagrams, data, or experimental results.

Sample Question:

The diagram below shows a food chain. Based on the diagram, explain how an increase in the rabbit population might affect the hawk population.

Answer:

An increase in the rabbit population would likely lead to an increase in the food supply for hawks, which are predators of rabbits. As a result, the hawk population may increase due to the greater availability of prey. However, this depends on other factors such as carrying capacity, availability of alternative prey, and environmental conditions.

Explanation:

This highlights the predator-prey relationship and the concept of ecological balance. When prey numbers increase, predator populations often follow, provided resources and environmental conditions are suitable.
