Governing Principles and Equations

The analysis of fluid systems relies heavily on fundamental equations:

- Continuity Equation: Based on the conservation of mass, it states that for incompressible flows, the mass flow rate remains constant along a streamline:

$$A_1 V_1 = A_2 V_2$$

where A is the cross-sectional area, and V is the flow velocity.

- Bernoulli's Equation: Represents the conservation of energy along a streamline, linking pressure, velocity, and elevation:

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

It's fundamental for analyzing ideal flows but requires modifications for real, viscous fluids.
