Preparation and Setup for the ANSYS CFX Wind Turbine Blade Simulation

A successful CFD simulation hinges on meticulous preparation. Here's a step-by-step overview:

1. Geometry Creation and Import

- Designing the Blade Geometry: Start with a detailed CAD model of the wind turbine blade. This can be created using CAD software like SolidWorks, CATIA, or Siemens NX, or sourced from existing design databases.

- Importing into ANSYS Workbench: Use the 'External Model' component to import your geometry into ANSYS Workbench for simulation setup.

2. Domain and Boundary Definitions

- Define the Computational Domain: Typically, a cylindrical or rectangular domain encompassing the blade is used to simulate the airflow. The domain should be large enough (at least 10-20 times the blade length upstream and downstream, and 5 times the blade height in cross-section) to minimize boundary effects.
- Boundary Conditions:
 - Inlet: Set as velocity inlet with specified wind speed (e.g., 12 m/s).
