

matlab code for image restoration Reference

matlab code for image restoration is an essential tool for researchers, engineers, and enthusiasts working in the field of image processing. Image restoration aims to recover an original image that has been degraded by factors such as noise, blur, or distortion. MATLAB, with its rich set of built-in functions and toolboxes, provides an excellent platform for implementing various algorithms to restore images effectively. In this comprehensive guide, we will explore different techniques of image restoration in MATLAB, including Wiener filtering, inverse filtering, Lucy-Richardson deconvolution, and more. We will also provide sample MATLAB code snippets and detailed explanations to help you understand and develop your own image restoration applications.

Understanding Image Degradation and Restoration

Before diving into MATLAB code, it is important to understand the underlying concepts of image degradation and restoration.

Image Degradation Model

The typical model for degraded images is:

$$g(x,y) = (h \otimes f)(x,y) + n(x,y)$$

Where:

- $g(x,y)$ is the observed degraded image.
- $f(x,y)$ is the original image.
- $h(x,y)$ is the point spread function (PSF) or blur kernel.
- $n(x,y)$ is additive noise.
- $\otimes$ denotes convolution.

The goal of image restoration is to estimate $f(x,y)$ given $g(x,y)$, $h(x,y)$, and knowledge about noise.

Types of Degradation and Corresponding Restoration Techniques

- Blurring (Motion or Defocus): Restored using inverse filtering, Wiener filtering, or deconvolution.
- Additive Noise: Addressed with filtering techniques like Wiener or total variation methods.

- Combined Effects: Require more sophisticated algorithms like iterative deconvolution.

Common Image Restoration Techniques in MATLAB

This section discusses popular methods and their MATLAB implementations.

1. Inverse Filtering

Inverse filtering attempts to directly invert the degradation process:

$$\hat{F}(u,v) = \frac{G(u,v)}{H(u,v)}$$

where $G(u,v)$ and $H(u,v)$ are Fourier transforms of the degraded image and PSF, respectively.

Limitations:

- Sensitive to noise.
- Not effective if $H(u,v)$ contains zeros or near-zero values.

Sample MATLAB Code:

```
``matlab

% Load degraded image

g = im2double(imread('degraded_image.png'));

% Define PSF (e.g., motion blur)

psf = fspecial('motion', 20, 45);

% Fourier transforms

G = fft2(g);

H = fft2(psf, size(g,1), size(g,2));

% Inverse filter
```

```

epsilon = 1e-3; % small constant to avoid division by zero

F_hat = G ./ (H + epsilon);

% Inverse Fourier transform

f_restored = real(ifft2(F_hat));

% Display results

figure;

subplot(1,2,1); imshow(g); title('Degraded Image');

subplot(1,2,2); imshow(f_restored); title('Restored Image using Inverse Filter');

...

```

Note: This method works best when the PSF is known, and noise levels are low.

2. Wiener Filtering

Wiener filtering improves upon inverse filtering by considering noise statistics, providing a more robust restoration in noisy environments.

Wiener Filter Formula:

$$\hat{F}(u,v) = \frac{H^*(u,v)}{|H(u,v)|^2 + S_N(u,v)/S_F(u,v)} \cdot G(u,v)$$

where:

- $H^*(u,v)$ is the complex conjugate of $H(u,v)$.
- $S_N(u,v)$ and $S_F(u,v)$ are power spectra of noise and original image, respectively.

Sample MATLAB Code:

```

%% matlab

% Load degraded image

```

```
g = im2double(imread('degraded_image.png'));

% Define PSF

psf = fspecial('motion', 20, 45);

% Fourier transforms

G = fft2(g);

H = fft2(psf, size(g,1), size(g,2));

% Estimate noise-to-signal power ratio

NSR = 0.01; % Adjust based on noise level

% Wiener filter

H_conj = conj(H);

Wiener_filter = H_conj ./ (abs(H).^2 + NSR);

% Apply filter

F_hat = Wiener_filter .* G;

% Inverse Fourier transform

f_restored = real(ifft2(F_hat));

% Display results

figure;

subplot(1,2,1); imshow(g); title('Degraded Image');

subplot(1,2,2); imshow(f_restored); title('Restored Image using Wiener Filter');

...
```

Advantages:

- Handles noisy data effectively.
- Requires estimation of noise-to-signal ratio.

3. Lucy-Richardson Deconvolution

This iterative algorithm is effective for recovering images blurred by known PSF, especially in low-noise conditions.

Algorithm overview:

- Starts with an initial estimate.
- Iteratively refines the estimate to maximize the likelihood.

MATLAB Implementation:

```
```matlab

% Load degraded image

g = im2double(imread('degraded_image.png'));

% Define PSF

psf = fspecial('motion', 20, 45);

% Number of iterations

num_iterations = 20;

% Perform Lucy-Richardson deconvolution

f_restored = deconvlucy(g, psf, num_iterations);

% Display results

figure;

subplot(1,2,1); imshow(g); title('Degraded Image');

subplot(1,2,2); imshow(f_restored); title('Restored Image using Lucy-Richardson');
```

```

Advantages:

- Handles Poisson noise well.
- Suitable for images with known PSF.

Implementing Custom Image Restoration in MATLAB

While built-in functions simplify many processes, developing custom algorithms offers greater control and understanding.

Steps to Develop a Custom Restoration Algorithm

- Load and pre-process the degraded image.
- Estimate or define the PSF based on degradation characteristics.
- Transform images to the frequency domain using FFT.
- Apply the chosen restoration filter or algorithm.
- Transform back to the spatial domain.
- Post-process the restored image (e.g., contrast adjustment).

Sample Workflow for a Custom Wiener Filter

```matlab

% Load image

g = im2double(imread('degraded\_image.png'));

% Define or estimate PSF

psf = fspecial('gaussian', 15, 3);

% Fourier transforms

G = fft2(g);

H = fft2(psf, size(g,1), size(g,2));

```
% Estimate noise-to-signal ratio
```

```
NSR = 0.02; % Adjust based on noise estimation
```

```
% Apply Wiener filter
```

```
H_conj = conj(H);
```

```
W_filter = H_conj ./ (abs(H).^2 + NSR);
```

```
F_estimate = W_filter . G;
```

```
% Inverse FFT to get restored image
```

```
restored_img = real(iff2(F_estimate));
```

```
% Display
```

```
figure;
```

```
subplot(1,2,1); imshow(g); title('Original Degraded Image');
```

```
subplot(1,2,2); imshow(restored_img); title('Restored Image');
```

```
...
```

Matlab code for image restoration is a powerful tool for researchers, engineers, and hobbyists interested in improving the quality of degraded images. Image restoration aims to recover an original image that has been corrupted by factors such as noise, blurring, or other distortions. MATLAB, with its extensive suite of image processing functions and user-friendly environment, offers an ideal platform for developing, testing, and deploying image restoration algorithms. This article provides a comprehensive overview of MATLAB code for image restoration, exploring essential concepts, common techniques, implementation strategies, and practical considerations to help you harness MATLAB's capabilities effectively.

## Introduction to Image Restoration in MATLAB

Image restoration is an inverse problem that involves recovering an original image from a degraded observation. The degradation process can typically be modeled as:

$$[g = Hf + n]$$

where:

- $g$  is the observed (degraded) image,
- $H$  is the degradation (blurring) operator,
- $f$  is the original image,
- $n$  represents additive noise.

The goal of restoration is to estimate  $f$  given  $g$ , knowledge of  $H$ , and noise characteristics. MATLAB's robust image processing toolbox provides functions for implementing various restoration algorithms, including inverse filtering, Wiener filtering, and more advanced techniques like regularized methods and iterative algorithms.

## Common Image Degradation Models

Understanding the degradation model is crucial before applying restoration techniques. In MATLAB, the most common models are:

### Blurring (Convolution)

- Often modeled as convolution with a point spread function (PSF), such as a Gaussian or motion blur.
- MATLAB functions like `fspecial` generate PSFs, and `imfilter` applies the convolution.

### Additive Noise

- Typically modeled as Gaussian noise, which can be added using `imnoise`.

### Combined Blurring and Noise

- Most real-world scenarios involve both blurring and noise, requiring sophisticated restoration algorithms.

## Basic Restoration Techniques in MATLAB

### Inverse Filtering

- The simplest approach, directly dividing the Fourier transform of the degraded image by the PSF in the frequency domain.
- MATLAB implementation involves Fourier transforms using `fft2` and `ifft2`.

Pros:

- Simple and fast.
- Works well when noise is negligible and the PSF is known precisely.

Cons:

- Highly sensitive to noise.
- Cannot handle ill-conditioned problems.

Sample MATLAB code:

```
```matlab
```

```
G = fft2(degradedImage);
```

```
H = fft2(psf, size(degradedImage,1), size(degradedImage,2));
```

```
f_estimated = ifft2(G ./ H);
```

```
```
```

## Wiener Filtering

- An enhancement over inverse filtering that accounts for noise characteristics.
- Uses the Wiener filter formula:

$$F_w = \frac{H^*}{|H|^2 + S_n / S_f} \times G$$

where  $S_n$  and  $S_f$  are the power spectra of noise and original image.

Features:

- Noise-aware.
- Suppresses amplification of noise.

MATLAB implementation:

```
```matlab
```

```
restoredImage = deconvwnr(degradedImage, psf, noisePower);
```

```
```
```

Pros:

- More robust to noise.
- Easy to implement with built-in functions.

Cons:

- Requires estimation of noise and signal power spectra.

## Advanced Image Restoration Techniques

### Regularized Filter Methods

- Incorporate regularization to stabilize the inversion process.
- Examples include Tikhonov regularization and constrained least squares.

Implementation in MATLAB:

- Often involves solving an optimization problem in the frequency domain.
- MATLAB's `deconvreg` function provides a straightforward implementation.

Sample code:

```
```matlab
```

```
restoredImage = deconvreg(degradedImage, psf, regParameter);
```

```

Advantages:

- Balances fidelity and smoothness.
- Handles ill-posed problems effectively.

## Iterative Restoration Algorithms

- Methods like Landweber iteration, Richardson-Lucy deconvolution, and conjugate gradient methods.
- Often more effective for complex or severe degradations.

Richardson-Lucy Deconvolution:

- An expectation-maximization algorithm tailored for Poisson noise.
- MATLAB implementation via ``deconvlucy``:

```matlab

```
restoredImage = deconvlucy(degradedImage, psf, numIterations);
```

```

Pros:

- Handles Poisson noise well.
- Produces high-quality restorations with sufficient iterations.

Cons:

- Computationally intensive.
- Requires careful parameter tuning.

## Implementing Image Restoration in MATLAB

To effectively implement image restoration algorithms, consider the following steps:

## 1. Preprocessing

- Convert images to grayscale if necessary.
- Normalize image intensities.
- Estimate the PSF if unknown, using methods like blind deconvolution or edge analysis.

## 2. Noise Estimation

- Use noise estimation techniques to determine noise variance, essential for Wiener and regularized filters.

## 3. Selecting the Appropriate Algorithm

- Based on the degradation model, image characteristics, and computational resources.

## 4. Parameter Tuning

- Adjust regularization parameters, iteration counts, and noise estimates for optimal results.

## 5. Postprocessing

- Apply contrast enhancement or denoising if needed.

## Practical Considerations and Tips

- PSF Estimation: When the PSF is unknown, blind deconvolution algorithms are necessary. MATLAB's ``deconvblind`` function offers such capabilities.
- Boundary Effects: Handle image boundaries carefully to avoid artifacts. Use padding or boundary extension techniques.
- Computational Cost: Iterative methods can be slow; consider downsampling or GPU acceleration for large images.
- Quality Metrics: Use metrics like PSNR, SSIM, or visual assessment to evaluate restoration quality.

### Pros of MATLAB for Image Restoration:

- Extensive built-in functions (``deconvwnr``, ``deconvlucy``, ``deconvreg``, etc.).
- Easy-to-write code with high-level abstractions.
- Visualization tools for debugging and quality assessment.
- Support for custom algorithms and integration with other toolboxes.

### Cons:

- Licensing cost for MATLAB.
- Performance limitations for very large images or real-time applications.
- Requires understanding of underlying mathematical principles for optimal results.

## Emerging Trends and Advanced Topics

- Deep Learning Approaches: MATLAB supports deep learning frameworks, allowing the development of neural network-based restoration methods.
- Blind Deconvolution: Algorithms that estimate both the PSF and the original image simultaneously.
- Super-Resolution Techniques: Combining multiple degraded images to produce a higher-resolution result.
- Hybrid Methods: Combining traditional algorithms with machine learning for improved performance.

## Conclusion

Matlab code for image restoration provides a versatile and accessible environment for tackling various image degradation problems. Whether you're applying simple inverse filtering or sophisticated iterative algorithms, MATLAB's rich set of functions and visualization tools streamline the process, making it easier to achieve high-quality restorations. As the field advances, integrating machine learning techniques and developing hybrid models will further enhance the capability of MATLAB-based image restoration workflows. With a solid understanding of the underlying models, algorithms, and implementation strategies discussed here, you can confidently approach your image restoration projects and push the boundaries of what is possible with MATLAB.
