Key Concepts in Differential and Integral Calculus leithold tc7

Differential Calculus

Differential calculus revolves around the concept of a derivative, which measures the rate at which a function changes at any given point.

Definition of a Derivative

The derivative of a function $f(x)$ at point x is defined as:

[

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

]

This limit, if it exists, provides the slope of the tangent line to the curve at x .

Techniques of Differentiation

- Power Rule: $\frac{d}{dx} x^n = nx^{n-1}$
- Product Rule: $\frac{d}{dx} [uv] = u'v + uv'$
- Quotient Rule: $\frac{d}{dx} \frac{u}{v} = \frac{u'v - uv'}{v^2}$
- Chain Rule: $\frac{d}{dx} f(g(x)) = f'(g(x)) \cdot g'(x)$

Applications of Differentiation

- Finding slopes of tangent lines
- Determining local maxima and minima

- Analyzing concavity and inflection points
- Solving optimization problems
- Calculating rates of change in physical systems

Integral Calculus

Integral calculus deals with the concept of integration, which can be thought of as the accumulation of quantities or the area under a curve.

Definite and Indefinite Integrals

- Indefinite Integral: Represents a family of functions:

$\int$

$$\int f(x) \, dx = F(x) + C$$

$\int$

where $(F'(x) = f(x))$, and (C) is an arbitrary constant.

- Definite Integral: Represents the accumulated quantity between two bounds:

$\int$

$$\int_a^b f(x) \, dx$$

$\int$

which calculates the net area under $(f(x))$ from $(x=a)$ to $(x=b)$.

Techniques of Integration

- Substitution: Simplifies integrals by changing variables.
- Integration by Parts: Based on the product rule for differentiation.
- Partial Fractions: Breaks complex rational functions into simpler fractions.
- Trigonometric Substitutions: Useful for integrals involving $(\sqrt{a^2 - x^2})$ or similar forms.

Fundamental Theorem of Calculus leithold tc7

This theorem bridges differential and integral calculus, stating that:

- If F is an antiderivative of f , then:

[

$$\int_a^b f(x) \, dx = F(b) - F(a)$$

]

- The derivative of an integral with a variable upper limit is:

[

$$\frac{d}{dx} \int_a^x f(t) \, dt = f(x)$$

]

This theorem underpins much of the calculus framework, enabling the evaluation of definite integrals via antiderivatives.
