Common Year 10 Consumer Arithmetic Questions and How to Approach Them

Understanding the types of questions and the strategies to approach them is crucial for success. Let's examine some typical questions and step-by-step methods to solve them.

1. Calculating Percentages

Percentages form the foundation of many consumer arithmetic questions. They are used to determine discounts, interest, and profit margins.

Sample Question:

What is 15% of \$200?

Solution Strategy:

- Convert the percentage to a decimal: $15\% = 0.15$
- Multiply the total amount by this decimal: $\$200 \times 0.15 = \30
- The answer is \$30.

2. Calculating Discounts and Sale Prices

Shopping scenarios often involve applying discounts to original prices. Being able to find the sale price after discounts is a common question type.

Sample Question:

A jacket costs \$80. If there's a 25% discount, what is the sale price?

Solution Strategy:

- Calculate the discount amount: $25\% \text{ of } \$80 = 0.25 \times \$80 = \$20$
- Subtract the discount from the original price: $\$80 - \$20 = \$60$
- The sale price is \$60.

3. Profit and Loss Calculations

Understanding profit and loss is vital for anyone involved in buying or selling goods.

Sample Question:

An item is bought for \$50 and sold for \$70. What is the profit percentage?

Solution Strategy:

- Calculate profit: $\$70 - \$50 = \$20$
- Calculate profit percentage: $(\text{Profit} \div \text{Cost Price}) \times 100 = (\$20 \div \$50) \times 100 = 40\%$
- The profit percentage is 40%.

4. Simple and Compound Interest

Interest calculations are common in banking and investment questions. Knowing the difference between simple and compound interest is essential.

Simple Interest Sample Question:

Calculate the simple interest on \$1,000 at an annual interest rate of 5% over 3 years.

Solution Strategy:

- Use the formula: Simple Interest = Principal $\times$ Rate $\times$ Time
- Convert rate to decimal: 5% = 0.05
- Calculate: $\$1,000 \times 0.05 \times 3 = \150
- The interest earned is \$150.

Compound Interest Sample Question:

Calculate the compound interest on \$2,000 at an annual rate of 4% compounded annually over 2 years.

Solution Strategy:

- Use the compound interest formula: $A = P(1 + r)^t$
- Where P = principal, r = rate per period, t = time in years
- Calculate: $A = 2000 \times (1 + 0.04)^2 = 2000 \times 1.0816 = \2163.20
- Interest earned = $\$2163.20 - \$2000 = \$163.20$

Strategies for Solving Year 10 Consumer Arithmetic Questions

To excel in consumer arithmetic, students should develop effective problem-solving strategies.

1. Read the Question Carefully

Ensure consistency in units, especially when comparing prices or calculating per-unit costs.

Practical Examples and Walkthroughs

Let's examine some typical Year 10 questions with detailed solutions:

Example 1:

A pair of shoes costs £120. During a sale, they are offered at a 30% discount. What is the sale price?

Solution:

- Convert discount to decimal: $30\% = 0.30$
- Calculate discount amount: $£120 \times 0.30 = £36$
- Subtract discount from original price: $£120 - £36 = £84$

Answer: The sale price is £84.

Example 2:

A laptop originally costs £900. It is discounted by 15%. Later, an additional 10% off is applied to the new price. What is the final price?

Solution:

- First discount: $£900 \times 0.15 = £135$
- Price after first discount: $£900 - £135 = £765$
- Second discount: $£765 \times 0.10 = £76.50$
- Final price: $£765 - £76.50 = £688.50$

Answer: The final price is £688.50.

Example 3:

James deposits £2,000 into a savings account that earns 4% simple interest annually. How much interest will he earn after 5 years?

Solution:

Interest = Principal $\times$ Rate $\times$ Time

Interest = $£2,000 \times 0.04 \times 5 = £400$

Remember, the key to mastery is consistency and understanding. With diligent practice and strategic thinking, you will be well-equipped to excel in Year 10 consumer arithmetic questions and beyond.

Question What is the total cost of purchasing 3 items priced at \$15.50 each, including a 10% sales tax? First, calculate the total cost before tax: $3 \times \$15.50 = \46.50 . Then, calculate the sales tax: 10% of \$46.50 = \$4.65. Finally, add the tax to the original amount: $\$46.50 + \$4.65 = \$51.15$. The total cost is \$51.15. A store offers a 25% discount on an item costing \$80. What is the discounted price? Calculate 25% of \$80: $0.25 \times \$80 = \20 . Then, subtract the discount from the original price: $\$80 - \$20 = \$60$. The discounted price is \$60. If a product's original price is \$120 and it is on sale with a 15% discount, what is the sale price? Calculate 15% of \$120: $0.15 \times \$120 = \18 . Then, subtract the discount from the original price: $\$120 - \$18 = \$102$. The sale price is \$102. A customer buys 2 notebooks at \$3.50 each and 1 pen costing \$1.20. What is the total amount spent before taxes? Total cost of notebooks: $2 \times \$3.50 = \7.00 . Cost of pen: \$1.20. Add both: $\$7.00 + \$1.20 = \$8.20$. The total amount spent is \$8.20. If a pair of shoes costs \$90 and there is a 20% VAT included, what is the net price before VAT? Let the net price be x . Since VAT is 20%, total price = $x + 0.20x = 1.20x$. Given total price is \$90, so $1.20x = \$90$. Solve for x : $x = \$90 \div 1.20 = \75 . The net price before VAT is \$75.
