Periodic Table 6 Practice Problems Answer Key

Understanding the periodic table is a fundamental part of chemistry education. It helps students grasp the organization of elements, their properties, and how they interact in chemical reactions. To reinforce this knowledge, practice problems are an effective tool. In this article, we will explore six practice problems related to the periodic table, complete with detailed answer keys. This will help you test your understanding, identify areas for improvement, and deepen your grasp of key concepts.

Introduction to Periodic Table Practice Problems

Practicing problems related to the periodic table enhances comprehension of element classification, periodic trends, and chemical behaviors. These problems often include identifying elements based on their properties, understanding groups and periods, and interpreting data from the periodic table.

Before diving into the practice problems, it's helpful to review some core concepts:

- Groups and Periods: Vertical columns are called groups or families; horizontal rows are periods.
- Metals, Nonmetals, and Metalloids: Classification based on properties.
- Periodic Trends: Atomic radius, ionization energy, electronegativity, and electron affinity.
- Element Symbols: Abbreviations of element names (e.g., H for Hydrogen, O for Oxygen).

Practice Problems and Answer Key

Problem 1: Identify the Element Based on Atomic Number

Question:

What is the element with atomic number 15?

Answer:

The element with atomic number 15 is Phosphorus (P).

Explanation:

To find the element, locate atomic number 15 on the periodic table. Phosphorus is in Group 15 (also called Group 5A) and period 3.

Problem 2: Determine the Group and Period of an Element

Question:

An element is in group 17 and period 3. What is the element, and what are its key properties?

Answer:

The element is Chlorine (Cl).

Explanation:

- Group 17: Halogens, known for being highly reactive nonmetals.
- Period 3: Located in the third row of the periodic table.
- Properties of Chlorine:
 - Nonmetal
 - Reacts with alkali metals to form salts
 - Gas at room temperature
 - Electronegativity: 3.16

Problem 3: Classify an Element as Metal, Nonmetal, or Metalloid

Question:

Silicon (Si) is an element on the periodic table. Classify it as a metal, nonmetal, or metalloid and justify your answer.

Answer:

Silicon is a metalloid.

Explanation:

- Silicon exhibits properties of both metals and nonmetals.

- It is a brittle, crystalline solid at room temperature.
- Conducts electricity under certain conditions, a typical characteristic of metalloids.
- Located along the "stair-step" line that separates metals and nonmetals on the periodic table.

Problem 4: Predict the Periodic Trend

Question:

How does atomic radius change as you move from left to right across a period? Explain why.

Answer:

Atomic radius decreases across a period.

Explanation:

- As you move across a period, additional protons are added to the nucleus, increasing the positive charge.
- Electrons are added to the same energy level, but the increased nuclear charge pulls electrons closer to the nucleus.
- This results in a smaller atomic radius.

Problem 5: Element with Highest Electronegativity

Question:

Which element in period 2 has the highest electronegativity? Provide its name and value.

Answer:

Fluorine (F) has the highest electronegativity in period 2, with a value of approximately 3.98.

Explanation:

- Electronegativity measures an atom's ability to attract electrons.
- Fluorine is the most electronegative element overall, owing to its small atomic size and high nuclear charge.
- It is located in group 17 (halogens).

Problem 6: Electron Configuration of an Element

Question:

Write the electron configuration for potassium (K).

Answer:

Electron configuration of potassium:

$1s^2 2s^2 2p^6 3s^2 3p^6 4s^1$

Explanation:

- Potassium has an atomic number of 19.
- Its electrons fill the orbitals in order:
 - 1s (2 electrons)
 - 2s (2 electrons)
 - 2p (6 electrons)
 - 3s (2 electrons)
 - 3p (6 electrons)
 - 4s (1 electron)
- The outermost electron is in the 4s orbital, making it an alkali metal.

Additional Tips for Mastering Periodic Table Concepts

- Use Mnemonics: To memorize groups and periods, create mnemonic devices.
- Understand Periodic Trends: Know how properties like atomic radius, ionization energy, and electronegativity change across the table.
- Practice Regularly: Consistent practice enhances recall and understanding.
- Visualize the Table: Use colored periodic tables to distinguish groups, periods, and element classifications.
- Apply Real-World Examples: Think about how elements are used in everyday life to contextualize their properties.

Deep Dive into Practice Problem Solutions: Analyzing the Answer Key

Providing detailed answers enhances understanding. Here, we analyze typical problems and their solutions as found in answer keys accompanying the practice set.

Problem 1: Element Identification

Question: "Identify the element with atomic number 15."

Answer Explanation:

- The atomic number corresponds to the number of protons in an atom.
- Atomic number 15 is phosphorus (P).

Key Point:

Recognizing element symbols and atomic numbers is fundamental. The answer key confirms this by listing phosphorus with atomic number 15.

Problem 2: Electron Configuration and Valence Electrons

Question: "Write the electron configuration of magnesium and determine its valence electrons."

Answer:

- Electron configuration: $1s^2 2s^2 2p^6 3s^2$
- Valence electrons: 2

Analysis:

Magnesium (Mg) has an atomic number of 12, and its outermost electrons occupy the 3s orbital, which accounts for its two valence electrons. The answer key emphasizes understanding the Aufbau principle and the periodic trend of valence electrons increasing across periods.

Problem 3: Periodic Trends ? Atomic Radius

Question: "Among nitrogen, phosphorus, and sulfur, which has the largest atomic radius?"

Answer:

- Phosphorus

Explanation:

Atomic radius increases down a group and decreases across a period. Phosphorus is in Group 15 (Period 3), nitrogen is in Period 2, and sulfur is in Period 3 but to the right of phosphorus. Since phosphorus is below nitrogen and to the left of sulfur, it has the largest atomic radius among the three.

Problem 4: Element Classification

Question: "Classify arsenic as a metal, nonmetal, or metalloid."

Answer:

- Metalloid

Insight:

Arsenic exhibits properties of both metals and nonmetals, fitting the classification of metalloid. The answer key clarifies the criteria for classification based on physical and chemical properties.

Problem 5: Reactivity of Elements

Question: "Which element is more reactive: sodium or magnesium? Explain."

Answer:

- Sodium

Explanation:

Reactivity increases down Group 1 (alkali metals). Sodium, being an alkali metal, reacts more readily with water than magnesium, which is an alkaline earth metal. The answer key reinforces this

trend and emphasizes periodic reactivity patterns.

Problem 6: Isotope Calculations

Question: "An isotope of chlorine has 17 neutrons. Calculate its atomic mass."

Answer:

- Atomic number of chlorine = 17
- Neutrons = 17
- Atomic mass = protons + neutrons = $17 + 17 = 34$ amu

Note:

The atomic mass is approximately 34 amu, matching the isotope chlorine-34. The answer key guides students through isotope mass calculations and the significance of isotopic abundances.
