Introduction to RDBMS

What is RDBMS?

A Relational Database Management System (RDBMS) is a type of database management system based on the relational model introduced by E.F. Codd. It stores data in the form of tables (also called relations), which consist of rows (records) and columns (attributes). RDBMS allows users to create, read, update, and delete data efficiently while maintaining data integrity and security.

Features of RDBMS

- **Structured Data Storage:** Data is stored in tables with predefined schemas.
- **Data Integrity and Accuracy:** Constraints and rules ensure data consistency.
- **Support for SQL:** Standardized language for querying and managing data.

- **Concurrency Control:** Multiple users can access and modify data simultaneously without conflicts.
- **Data Security:** Authentication, authorization, and encryption mechanisms.

Core Components of RDBMS

1. Tables (Relations)

Tables are the primary data storage units. Each table consists of:

- Columns: Define data types and attributes.

- **Third Normal Form (3NF):** Eliminates transitive dependencies.
- **Boyce-Codd Normal Form (BCNF):** Handles certain types of anomalies beyond 3NF.

Relationships in RDBMS

Relationships define how tables relate to each other.

- **One-to-One:** Each row in Table A relates to one row in Table B.
- **One-to-Many:** One row in Table A relates to multiple rows in Table B.
- **Many-to-Many:** Multiple rows in Table A relate to multiple rows in Table B, often managed via junction tables.
