Understanding Basic Concepts of Area

What is Area?

Area refers to the amount of surface covered by a two-dimensional shape. It is measured in square units such as square centimeters (cm²), square meters (m²), or square inches (in²). Calculating the area allows us to determine how much space a shape occupies.

Importance of Area in Real Life

Understanding area calculations helps in various fields such as:

- Architecture and construction (flooring, wall painting)
- Agriculture (farming land measurement)
- Interior design (carpet or tile coverage)
- Art and design (canvas or paper sizes)

Area of Basic Shapes: Rectangles, Squares, and Parallelograms

Rectangle

- Formula: $\text{Area} = \text{length} \times \text{width}$
- Properties: Opposite sides are equal, and angles are right angles.

- Notation: If length = L and width = W , then Area = $L \times W$.

Square

- Formula: Area = side $\times$ side = side²
- Properties: All sides are equal, and angles are right angles.
- Note: The square is a special case of a rectangle.

Parallelogram

- Formula: Area = base $\times$ height
- Properties: Opposite sides are equal and parallel; angles are not necessarily right angles.
- Note: The height is the perpendicular distance between the bases.

Common Types of Parallelogram Area Problems

- Calculating area when base and height are known

- Finding missing height or base when the area and other dimensions are given
- Using diagonal and side lengths to find area

Key Concepts for Parallelogram Problems

- The height is perpendicular to the base, not necessarily the side length.
- Sometimes, the problem involves the use of other properties, such as diagonals or angles.

Sample Problems and Solutions

Problem 5: A parallelogram has a base of 15 meters and a height of 8 meters. Find its area.

Solution:

- $\text{Area} = \text{base} \times \text{height}$
- $\text{Area} = 15 \times 8 = 120$ square meters

Problem 6: The area of a parallelogram is 180 square meters, and the base length is 12 meters. Find the height.

Solution:

- $\text{height} = \frac{\text{Area}}{\text{base}}$
- $\text{height} = \frac{180}{12} = 15$ meters

Problem 7: In a parallelogram, if the side length is 10 meters and the height is 6 meters, what is the area? (Assume the side length is the base.)

Solution:

- $\text{Area} = \text{base} \times \text{height} = 10 \times 6 = 60$ square meters

Complex Application Problems

- Using diagonals to find the area when height is unknown.
- Estimating land area from irregular measurements involving parallelogram-shaped plots.

Advanced Word Problems and Real-World Applications

Real-life scenarios often involve combining multiple shapes and dimensions, requiring critical thinking and multi-step calculations.

Examples of Complex Word Problems

Example 1: A rectangular garden measures 50 meters in length and 30 meters in width. A path of uniform width surrounds the garden, increasing its total area to 2,500 square meters. Find the width of the path.

Solution Approach:

- Let w be the width of the path.
- Total dimensions including the path: $(50 + 2w)$ and $(30 + 2w)$.
- Set up the equation: $(50 + 2w)(30 + 2w) = 2500$.
- Expand and solve the quadratic:

[

$$(50 + 2w)(30 + 2w) = 2500$$

]

[

$$1500 + 100w + 60w + 4w^2 = 2500$$

]

[

$$4w^2 + 160w + 1500 = 2500$$

]

[

$$4w^2 + 160w - 1000 = 0$$

\]

- Divide through by 4:

\[

$$w^2 + 40w - 250 = 0$$

\]

- Use quadratic formula:

\[

$$w = \frac{-40 \pm \sqrt{40^2 - 4 \times 1 \times (-250)}}{2}$$

\]

\[

$$w = \frac{-40 \pm \sqrt{1600 + 1000}}{2} = \frac{-40 \pm \sqrt{2600}}{2}$$

\]

- Approximate:

\[

$$\sqrt{2600} \approx 50.99$$

\]

- Possible solutions:

\[

$$w = \frac{-40 + 50.99}{2} \approx \frac{10.99}{2} \approx 5.495$$

$$\sqrt{}$$

$$\sqrt{}$$

$$w = \frac{-40 - 50.99}{2} \approx \frac{-90.99}{2}$$

Question How do you find the area of a rectangle with length 8 meters and width 5 meters? Multiply the length by the width: $8 \times 5 = 40$ square meters. A square has a perimeter of 36 meters. What is its area? First, find the side length: $36 \div 4 = 9$ meters. Then, $\text{area} = 9 \times 9 = 81$ square meters. If the base of a parallelogram is 10 cm and the height is 7 cm, what is its area? $\text{Area} = \text{base} \times \text{height} = 10 \times 7 = 70$ square centimeters. A rectangle's length is twice its width. If the area is 48 square meters, what are the dimensions? Let width = w , then length = $2w$. $\text{Area} = w \times 2w = 2w^2 = 48$. So, $w^2 = 24$, $w \approx 4.9$ meters. Length ≈ 9.8 meters. How do you determine the area of a parallelogram given the diagonals and the angle between them? Use the formula: $\text{Area} = \frac{1}{2} \times d_1 \times d_2 \times \sin(\text{angle between diagonals})$. What is the area of a square with a diagonal length of $10\sqrt{2}$ cm? Diagonal = $s\sqrt{2}$, so $s = \text{diagonal} / \sqrt{2} = 10\sqrt{2} / \sqrt{2} = 10$ cm. $\text{Area} = s^2 = 10 \times 10 = 100$ square centimeters. A rectangle has a length of 15 meters and an area of 150 square meters. What is its width? $\text{Width} = \text{area} \div \text{length} = 150 \div 15 = 10$ meters. How do you find the area of a rhombus if you know the lengths of its diagonals? $\text{Area} = \frac{1}{2} \times d_1 \times d_2$, where d_1 and d_2 are the diagonals. In a parallelogram, if the base is 12 cm and the height is 9 cm, what is its area? $\text{Area} = \text{base} \times \text{height} = 12 \times 9 = 108$ square centimeters.
